# LANDSLIDE RISK REDUCTION IN SRI LANKA

Eng.(Dr.) Asiri Karunawardena

**Director General** 

National Building Research Organization

#### LANDSLIDE RISK REDUCTION

## Risk Reduction Options

Living with landslide (Adaptation)

Mitigation (Risk Treatment)

Resettlement

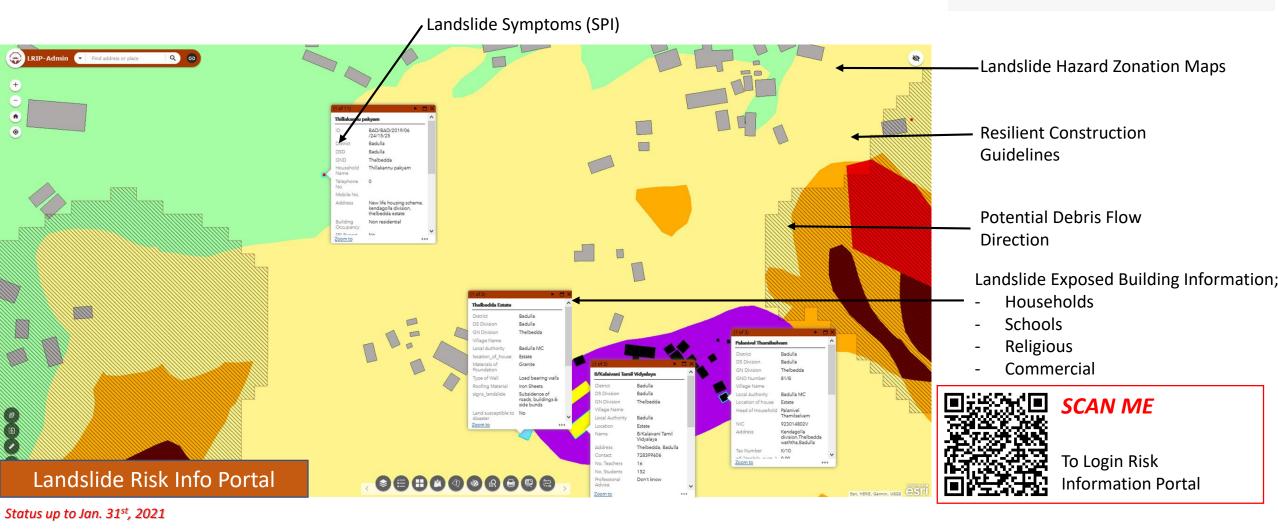

- Creating awareness for preparedness
- Landslide early warning
- Resilient Construction
- Risk Transfer
- Land use Management

- Local level mitigation program
- Land slide mitigation along major roads
- Land slide mitigation for protecting critical infrastructure, school, hospitals
- Large scale (National level)

- Safe land provided + Rs 1.2 Min for House construction
- Additional Rs 0.4 Mn for buying a land
- Providing Rs1.6 Mn for buying house in safe land
- Owner driven approach

## LANDSLIDE RISK MANAGEMENT

12,104 SPI High Risk Buildings

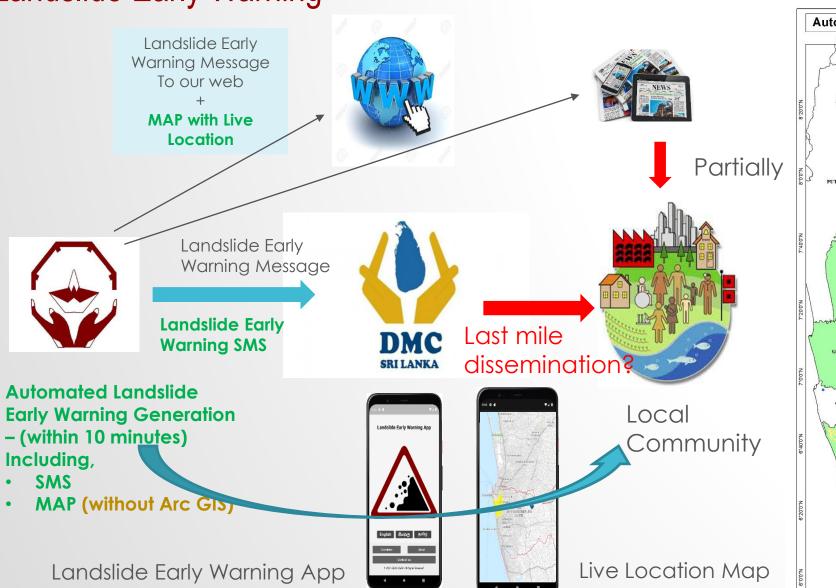

14,313
Housing Units to be Resettle

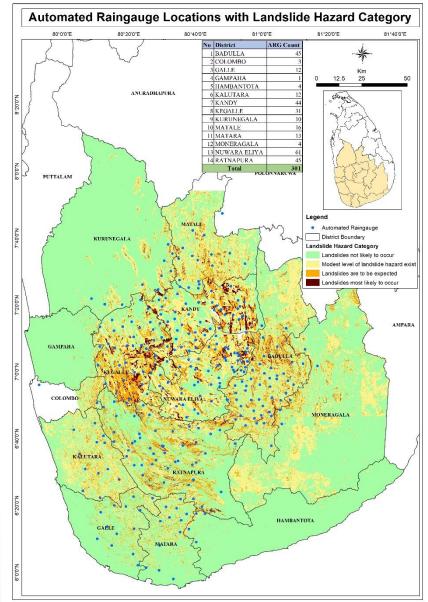

1,382
Resettled Houses

1,840 Resettlement in Progress Landslide Early Warning

About 300 Nos of Automated Rain gauges Data is shared with relevant technical agencies including ICHARM have been installed in catchment area

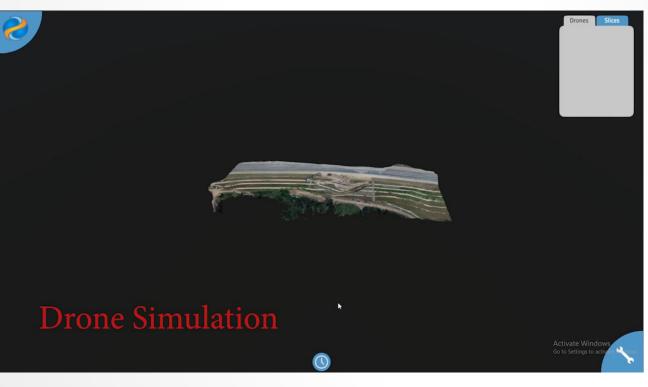

## SPATIAL APPLICATION FOR LANDSLIDE

Aerial Photographs obtained from drone surveys are used to generate the contour profiles of sloping terrains

#### Key features

3D modelling & Virtual Reality (VR)

Cross sections

Upload the Engineering drawings and measurements

Time series data analysis

Engineering notes and Annotation

### **CHALLENGES & FUTURE TARGETS**

## Implementation of Online Synthesis System (OSS) for landslide Risk Reduction

- Soil moisture and Precipitation Thresholds for Real-time Landslide Prediction
   Rain fall –Runoff/ Infiltration model – DIAS simulation
- Development of cost benefit analysis for planning of mitigation work
- Damage assessment tool for landslide damage
- Contingency plans for reduction of landslide impact and post disaster recovery
- Capacity Building in landslide monitoring, landslide risk management, contingency planning, cost benefit analysis, etc.

# Thank You
